

IRU3073 EVALUATION BOARD USER GUIDE

INTRODUCTION

The IRU3073 controller IC is designed to provide a low cost synchronous Buck regulator for on-board DC to DC converter for multiple output applications.

The outputs can be programmed as low as 0.8V for low voltage applications.

Selectable over-current protection is provided by using external MOSFET's on-resistance for optimum cost and performance.

This device features a programmable frequency set from 200KHz to 400KHz, under-voltage lockout for all input supplies, an external programmable soft-start function as well as output under-voltage detection that latches off the device when an output short is detected.

SPECIFICATION DATA

Switcher:	Linear	Supply Voltage:
$V_{IN} = 5V$	Regulator:	$V_{CC} = V_C = 12V$
$V_{OUT1} = 2.5V$	$V_{IN} = 2.5V$	
$I_{OUT1} = 8A$	(from switch)	
$\Delta V_{OUT} = 50mV$	$V_{OUT2} = 1.6V$	
$F_S = 200KHz$	$I_{OUT2} = 2A$	

INPUT/OUTPUT CONNECTIONS

The following is the input/output connections:

Inputs:

JP3: Input (+5V), Gnd

JP1: Input (+12V)

Outputs:

JP4: V_{OUT1} (+2.5V), Gnd

JP2: V_{OUT2} (+1.6V), Gnd

The connection points is shown in Figure 1. Connect the power supply cables according to this figure, minimize wire lengths to reduce losses in the wire. Test point J1 provides easy connections for the oscilloscope voltage probe to monitor the output voltage.

Note: For proper operation, +5V supply should ramp up first.

CONNECTION DIAGRAM

LAYOUT

The four layers for IRU3073 evaluation board are shown in Figures 2.1-2.4. The layout is designed both for direct FET package and SOIC package for power MOSFETs. The input capacitors are all located close to the MOSFETs. All the decoupling capacitors and feedback components are located close to IC. The feedback re-

sistors are tied to the output voltage at the point of regulation.

The middle layers are dedicated to Power Ground and Analog Ground. Analog Ground is kept separated from the Power Ground and it is connected at a single point as shown in figure 2.3.
