## 1. Overview

S5U1C17F57T1 and S5U1C17F57T2 (SVT17F57: Software eValuation Tool for S1C17F57) are the evaluation and development support board for S1C17F57 single chip microcontroller made by Seiko Epson.

It is composed of CPU board and peripheral board, the CPU board has built-in IC socket, the extension connectors, and the debugging connectors, etc. for S1C17F57, the peripheral board has built-in EPD (Electrophoretic Display), EPD connection connectors, pads, enhancing EPD driver (S1D14F51), the buzzer, and the key switch, etc. in S5U1C17F57T1. As a result, the EPD drive display, buzzer drive, and the switch can be input.

As for S5U1C17F57T2, it is composed only of CPU board used for S5U1C17F57T1, and various applications are possible with extension connectors.

1) CPU	S1C17F57 (QFP15-128)
2) Input power voltage	External power supply (DC3.0V) Coin battery (CR2032 : 3.0V)
3) CPU clock	OSC1 : 32.768kHz crystal oscillator OSC3 : 4.000MHz crystal oscillator
4) Built-in devices	
CPU board :	IC socket for S1C17F57 (Built-in S1C17F57) Crystal oscillator Reset switch Extension connector Pilot LED USB interface connector Function switching jumpers
Peripheral board :	Enhancing EPD driver (S1D14F51) EPD connection connectors, connectors pads Key switches Buzzer Power switch Function switching jumpers

\*1 SVT17F57 is a generic name of S5U1C17F57T1 and S5U1C17F57T2. It becomes another sale, and confirms the model name, please when you buy it respectively.

\*2 S5U1C17F57T1 is a package where CPU board and peripheral board make a set. Moreover, S5U1C17F57T2 is a package only of CPU board.

\*3 Because the coin battery folder is mounted on the peripheral board, the coin battery cannot be used with S5U1C17F57T2.

\*4 S1D14F51 is not mounted in prototype board.

# 1. Overview

---

## 1.1 Usage Method

The software debugging and the evaluation environment of S1C17F57 can be constructed with the following procedures.

- Single CPU board or CPU board is connected with the peripheral board and use it

<Software debugging >

- (1) CPU board connector CN2-1(J5) and CN2-2(J6) of SVT17F57 are connected with for target connection 4 pin connector and the Flash writing power supply 4pin connector for emulator respectively by using the cable bundled to S5U1C17001 H2 (emulator).
- (2) VDD power supply selection jumper switch (JP14) of CPU board is installed in the "EXT" side.
- (3) VPP power supply selection jumper switch (JP12) of CPU board is installed in the "ICD" side.
- (4) Jumper switch JP1, JP2, JP3, and JP17 of CPU board are short, and JP13, JP18, and JP19 open. Moreover, JP23 of the peripheral board opens when the peripheral board is connected.
- (5) Supply the power by the stabilized power supply device to CPU board power supply connector CN3 (J8) or the emulator is supplied. Please make the power supply voltage within the range of S1C17F57 of the operation power supply voltage.
- (6) The emulator is connected with PC by using the USB cable bundled to the emulator.

Please set to become a voltage input from the target the selection of the DSIO signal level of the emulator (dip switch SW4 and 5).

<The free run by the external source operates >

- (1) VDD power supply selection jumper switch (JP14) of CPU board is installed in the "EXT" side.
- (2) Jumper switch JP1, JP2, JP3, and JP17 of CPU board are short, and JP13, JP18, and JP19 open. Moreover, JP23 of the board in the peripheral board opens when the peripheral board is connected.
- (3) It supplies power to CPU board power supply connector CN3 (J8) by using the stabilizing supply device. Please make the power supply voltage within the range of S1C17F57 of the operation power supply.

<The free run operates with the coin battery (The set of CPU board and peripheral board is used)>

- (1) VDD power supply selection jumper switch (JP14) of CPU board is completely detached.
- (2) Jumper switch JP1, JP2, and JP3 of CPU board are short, JP13, JP17, JP18, and JP19 open, and JP23 of the peripheral board is connected with the "BATT" side.
- (3) The coin battery is installed in the battery folder mounted on the peripheral board.
- (4) Power on/off switch (SW2) of the peripheral board is turning on.

<The free run by the USB bus power operates >

- (1) VDD power supply selection jumper switch (JP14) of CPU board is installed in the "USB" side.
- (2) Jumper switch JP1, JP2, and JP3 of CPU board are short, and JP13, JP17, JP18, and JP19 open. Moreover, JP23 of the peripheral board opens when the peripheral board is connected.
- (3) CPU board is connected with PC by using the USB cable (mini plug).<sup>\*1</sup> Moreover, the operation power supply voltage of S1C17F57 is fixed by 3.3V.
- (4) Please install the USB driver of Silicon Laboratories for CP2102 according to the direction of PC.

<sup>\*1</sup> Please prepare the USB cable by the customer.
